Acknowledgements

We gratefully acknowledge the funding and support for the programme entitled Adaptive response and local scale adaptation for improving water security and increasing resilience to climate change in selected communities in Giyani, Limpopo. The programme is funded by the Government of Flanders, managed by the Water Research Commission and implemented by Tsogang Water and Sanitation, Association for Water and Rural Development (AWARD), University of the Western Cape (UWC) and the WRC's TTO Enterprise Development.

The Giyani Local Scale Climate Resilience Programme (GLSCRCP)

The Giyani Local Scale Climate Resilience Programme (GLSCRCP) aims to develop and implement activities that will research, develop and demonstrate climate adaptive responses and solutions for optimising water utilisation in drought-stricken areas. The programme will focus on the Greater Giyani Municipal area within the Mopani district and aims to impact an estimated 5000 beneficiaries over a three-year period in terms of water utilisation, improved water mix, and socio-economic opportunities as responses to climate adaptation. A 2019 WRC study on droughts and adaptation strategies has highlighted risks to reduced productivity, livelihoods and food security, and an increase in vector and water-borne diseases in communities such as Giyani. Ultimately, climate change impacts on water resources in the Giyani area cannot be underestimated.

The programme has three key areas that will support for improving local scale adaptation and resilience in Giyani. They are:

- 1) a strengthened enabling environment whereby local authorities, institutions, communities, traditional authorities and market players are mobilised to improve climate resilience and water utilisation;
- 2) improved energy, ground and surface water solutions developed with communities to optimise and diversify water sources;
- 3) activities that support livelihoods and local economic development opportunities.

The programme will cover a spectrum of rural and rural residential areas in Giyani, working closely with the Mopani District Municipality and the Greater Giyani Local Municipality. Implementation partners include Tsogang Water and Sanitation as the lead on water projects and infrastructure; Association for Water and Rural Development (AWARD) in support of capacity development and stakeholder engagement, University of the Western Cape (UWC) as the water and energy technical partner and the WRC's TTO Enterprise Development arm on social enterprise development supporting local economic development projects.

About this Technical Design document

This Technical Design document consists of a summary of all 9 GLSCR project sites. They are categorizable as Community Water Supply and Agricultural Cooperative projects. Technical designs for the infrastructure interventions at these sites are included with Google Earth images, as available. Detailed Technical Documents are available for each of the project sites as a Project Profile.

Who is the Technical Design document for?

This technical design document is meant for the Water Service Authority, the Mopani District Municipality and the Department of Agriculture as a record of programme interventions at each site.

What does the Technical Design document contain?

In this technical design document, we share important information on the type of interventions for each project site. We also share the technical designs for the infrastructure that was installed at each project site.

How to use the Technical Design Document?

The Water Service Authority will be able to use this technical design document to update their asset register for infrastructure upgrades, to have knowledge on the type of systems and infrastructure installed and how to maintain it. Furthermore, the Water Service Authority will be able to use this document as a point of reference for infrastructure budgeting purposes and to inform their borehole operators, supervisors and water quality technicians. The Community Water Committees will use the document as a point of reference to manage the system and for minor maintenance.

Technical Designs for Community Water Supply

The feasibility and design of the systems at each pilot site was refined in more detail based on the following aspects:

1. The original feasibility study conducted in WRC project No. C2020.2021-00718 (Jovanovic et al., 2021)
2. More specific coordinates, elevations measured at key points during the field campaign on 14-19 May 2022; further discussions with stakeholders that took place during the same field campaign
3. Technical information (static rest water levels and required pressure heads; water requirements pipeline layout, pipe diameter, installation and size of tanks; installation of booster pumps to secure enough water pressure is delivered)

The main method for the refinement of MUS technical design at pilot sites was the adapted Toolbox for Solar Powered Irrigation Systems (SPIS) (GIZ and FAO, 2021) and field measurements. Further refinement is possible once equipment specification and availability on the market from suppliers and manufacturers is known, as well as specific borehole characteristics and pumping tests. In particular, for the drinking water sources, the final work designs will consider the water treatment plant packages and the need for pressure booster pumps for water delivery to the distribution and storage systems. It should be noted that, for all sites, water meters will have to be installed at the point of abstraction and at the point of use, so that the efficiency of the distribution system can be assessed during performance evaluation, e.g. leakages and losses of water.

The following table describe the description and intervention for each community water supply project:

Community Water Supply	Interventions
Mzilela Community Water Supply	1. Hybrid Solar System installed: This innovation integrates grid-supply with solar power for the purposes of powering local groundwater supply systems. The innovation provides relief from grid load shedding and allows for cheaper access to water for rural villages.
	2. Security of Hybrid Solar System installed: Theft and vandalism can be problematic. The project installed palisade fencing, barbed fencing and alarm systems to protect investments.
	3. Borehole testing, equipping and skills development: All boreholes where tested for water quality and equipped with a suitable pump for the system. In all cases beneficiaries where trained to understand water quality monitoring procedures.
	4. Animal Drinking trough refurbished: This is a vital structure designed to provide water to livestock and other farm animals. It is an essential component in agricultural settings, ensuring that animals have access to clean and fresh water, which is crucial for their health, growth, and productivity.

	<p>5. Water Treatment system installed: This system is a compact, often portable, setup designed to purify and treat water for specific needs such as household use, agricultural purposes, or small-scale industrial applications. These systems are ideal for providing safe, clean water in environments where larger infrastructure may not be feasible or necessary.</p>

Table 1: Community Water Supply project sites and GLSCR intervention

1 Mzilela Community Water Supply

BACKGROUND

Mzilela village has a population of 1,150 requiring 28.8 m³ d⁻¹ or 10,512 m³ a⁻¹ (calculated as 25 L/person d⁻¹). There is seldom bulk water supply due to water shortages and the villagers make use of boreholes. The currently operating borehole No. MZI003 situated in the villages was proposed by the community as water source. Groundwater is pumped to 2 elevated Jojo tanks located in a village street (about 10 m high; about 300 m away). An elevated steel tank (approximately 200 m³) is located about 500 m from borehole No. MZI003.

INTERVENTION CONTENT

Installation of solar panels, electricity hybrid system and a water treatment plant for drinking water supply and livestock were done in Mzilela community water supply. The pump and accompanying solar panels array are installed at borehole No. MZI003 (elevation is 422 m). The water treatment is essential given the elevated NO₃ in the borehole water. A small reverse osmosis plant requires a pressure of 3 b (30 m) and it would consume 3-10 kWh of energy per m³ of water purified. From there, a pressure pump will likely be required to convey water through a 75 mm main pipeline to the Jojo tanks in the street village (elevation is 426 m). The pipeline is already in place.

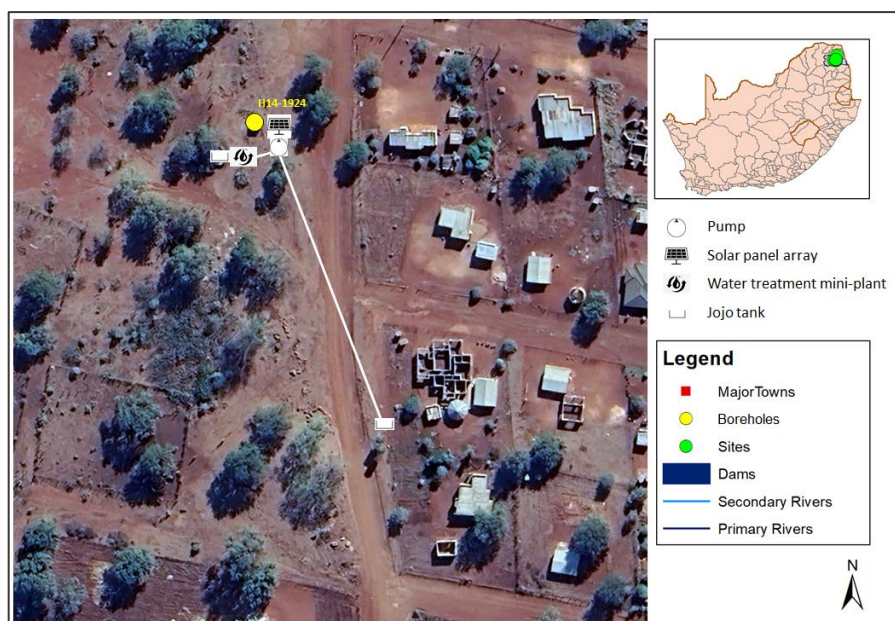

Figure 1: Final installation scheme of solar powered groundwater pumps for drinking water supply at Mzilela Village (background is Google Earth image)

Water Sources for the GLSCR project sites

Village	Site	Water requirements		Source of water	Coordinates		Duration	Purpose
		(m ³ d ⁻¹)	(m ³ a ⁻¹)		Latitude	Longitude		
Mbhedle	Village population = 1230	30.8*	11242	Borehole in village, not recorded	-	-	3 years	Drinking water. No bulk water supply, villagers have to walk up to 0.7 km to collect water. Site proposed by community members.
Mayephu	Village population = 1940	48.5*	17702.5	Borehole No. H14-1815	-23.589623°	30.778480°	3 years	Drinking water. Emergency intervention linked to bulk water supply. Borehole and reservoir are established.
				Borehole No. H14-1818	-	-		
Mzilela	Village population = 1150	28.8*	14162	Borehole in village	-23.592869°	30.17120°	3 years	Drinking water. Bulk water supply is seldom available due to water shortage (once per month).
Matsotsosela	Village population = 2300	57.5*	20987.5	Borehole No. H14-0026	-23.60106°	30.829530°	3 years	Drinking water. No bulk water supply. Boreholes are established. Diesel expenses subsidized by local government are extremely high. Community operator is very committed.
				Borehole No. H14-0025	-23.600749°	30.825683°		
Dzumeri	Nhlambeto farm	58.9**	21863.5	Non-perennial river sand	-23.561512°	30.701696°	3 years	Drinking water + emerging farm. Emerging farmer was recently asked to stop farming by other water users due to drop in groundwater level.
Dzumeri	Ngamba farm	33.9	12373.5	Borehole not numbered	-23.591533°	30.706566°	3 years	Emerging farm. Pressure head is too low with the current pumping system.
Dzumeri (Daniel Ravalela)	A hi tirheni Mqekwa farm	33.9	12373.5	Borehole No. H14-1699	-23.57025°	30.65841°	3 years	Emerging farm. Well established. Electricity bills are very high.
				Borehole No. H14-1700	-23.57094°	30.65878°		
Loloka	Duvadzi farm	33.9	12373.5	Borehole No. H14-1703	-23.56712°	30.81966°	3 years	Emerging farm. Well established. Groundwater can also be abstracted from adjacent non-perennial river sand.
Muyexe	Muyexe community project	33.9	12373.5	Borehole not numbered	-23.187820°	30.911963°	3 years	Emerging farm. Rehabilitation of cooperative by Limpopo Department of Agriculture is planned.

Table 2: GLSCR Water Sources for project sites

Water source quality for the GLSCR Project sites

Groundwater samples were collected during a field campaign on 26-31 October 2022 and collection of the samples is a continuous process in all the water sources. The samples were collected at the water sources according to standard procedures in 0.25 L plastic bottles, for chemical analyses in the laboratory. Water sources at all 9 pilot sites were sampled, except at Matsotsosela where borehole H14-0025 dried up and the pump at the currently operating borehole H14-1724 could not be started. The samples were kept in a cooler box with ice bricks, and sent to the Central Analytical Facility (CAF) of Stellenbosch University for laboratory analyses. The following physical and chemical parameters were analysed:

- Physical parameters: electrical conductivity (EC), total dissolved solids (TDS) and colour (Hazen)
- pH and total organic carbon (TOC)
- Anions: F, Cl, SO₄, NO₂, NO₃, Br
- Cations: Li, Na, Ca, Mg, K, NH₄
- Heavy metals: Al, Mn, Fe, Cu, Cd, Zn

All the results are presented in the tables below and they were compared to the South African National Standard SANS 241 of 2015 to determine the water quality fitness for domestic use. The figures in red in the tables indicates values of determinants that are not within the SANS 241 thresholds. For comparative purposes, the analyses of samples collected in the previous sampling campaign on 14-19 May 2022 are shown in the tables.

Although the pH values were within the range of drinking water quality standards for all sites, high salinity levels (Electrical Conductivity EC and Total Dissolved Solids TDS) were recorded at Mbhedle, A hi tirheni Mqekwa and Duvadzi, mainly due to elevated Na and Cl. High NO₃ levels were recorded at Mbhedle, Mayephu, Mzilela (borehole H14-0022), A hi tirheni Mqekwa and Muyexe, above the legally required standard for drinking water quality (<48.7 Mg L⁻¹ NO₃). The borehole at Mbhedle also displayed elevated NO₂ (6.698 mg/L). Total Organic Carbon (TOC) levels were within the standard drinking water quality range.

In comparison with the previous sampling campaign in May 2022, the elevated salinity values at Mbhedle, A hi tirheni Mqekwa farm and Duvadzi farm were confirmed. The elevated NO₃ at Mbhedle, Mayephu (borehole H14-1815), Mzilela, A hi tirheni Mqekwa and Muyexe were also confirmed due to the proximity of villages (draining water from villages). The spike of 205 mg L⁻¹ NO₃ concentration at borehole H14-1815 in Mayephu was confirmed due to the vicinity of an animal kraal. By far the best water quality source is the water retained in the sand alluvial aquifer of the Molototsi River (Nhlabeto farm at Dzumeri). This confirms previous results from the previous sampling campaign in May 2022. All parameters were within the standard limits, including colour. In general, the findings confirmed the need for groundwater treatment at sources for drinking water purpose. For agricultural purposes, water quality is fit to marginally fit for water use. The risk of salinization should be monitored at all sites.

GLSCRIP

GIYANI LOCAL SCALE CLIMATE RESILIENCE PROGRAMME

Government
of Flanders

award

UNIVERSITY of the
WESTERN CAPE

GLSCRIP is a community advised and LED programme demonstrating climate adaptive responses and solutions for improved water utilisation in the Giyani Municipal area. It is a partnership programme funded by the Government of Flanders, led by the Water Research Commission with partners Tsogang Water and Sanitation (Tsogang), Association for Water and Rural Development (AWARD) and the University of the Western Cape (UWC). The Programme aims to develop, research and demonstrate, practical water-linked climate adaptation solutions at local, community and catchment scale for the benefit of 5000 Giyani community members in order to improve water utilisation, community resilience and local economic growth for local and women-led enterprises.
